Bolsover

The Chesterfield Canal runs downhill from Norwood Tunnel to its junction with the River Trent at West Stockwith Lock. The western part of the canal is steep, and has narrow locks. The flatter eastern part has broad locks.

Dronfield The canal water originally came from four reservoirs at the summit near to the Norwood Tunnel. When the tunnel collapsed in 1907 two of the reservoirs became inaccessible, but Harthill and Pebley Reservoirs continue to provide water to the summit pound.

Diverted streams (Feeders (F)) and water pumped up from nearby rivers (P), also provide water to the canal on the eastern side where the broader locks require more water

When craft lock up and down between Stockwith Basin and the River Trent, the basin water level drops. A manually controlled pump can be used to lift water from the River Trent into the basin
